

Ocean Spray® Relies on Vibratory Shakers from Key Technology

Producing the finest sweetened dried cranberries (SDC) is a science that Ocean Spray® has been working to perfect. Ocean Spray relies on sanitary Smart Shaker® solutions from Key Technology. Key's versatile Iso-Flo® vibratory shakers convey sticky product on the packaging line and handle a wide range of functions on the processing line.

"Our goal is to produce the thickest, juiciest, plumpest SDC we can, and Key helps us achieve that goal," said Bob Lowder, Manager of Capital Engineering and MRO Programs. "Key's willingness to customize equipment, and the expertise of their engineering staff have been instrumental to our success." Ocean Spray maximizes product quality and line productivity while producing 10 to 12 million pounds of SDC per year on each of its Craisins production lines.

This Iso-Flo vibratory shaker incorporates a swing gate for distribution of in-process Craisins.

The Iso-Flo® vibratory shakers from Key do more than just convey product at Ocean Spray. While moving product between the units of operation that slice, extract, infuse, dry, and package, Iso-Flo shakers are used to clean, wash, dewater, de-syrup, size, and grade as well as convey. The cranberries have dramatically different characteristics at each stage

Bob Lowder of Ocean Spray checks the flow of production the low-maintenance Iso-Flo transfer line.

- from frozen product at the start to hot, sticky product after the dryer - and each stage requires a unique solution to handling the challenging product.

With Iso-Drive® frame-mounted drives and StrongArm™ spring arm assemblies, Iso-Flo distributes energy to the conveyor bed in a controlled natural-frequency operation. The low amplitude, high frequency movement minimizes product degradation and reduces maintenance.

"For the new line going into Markham, we'll use Key shakers again," noted Lowder. "Their technology is clearly at the forefront and we couldn't be happier with them. But we are trying something new in Markham, too - we'll

be installing Key's new laser sorter. After running two sorters side-by-side, we decided that Key's Raptor is the right system for us in this application."

The new Optyx® with Raptor Laser Technology going into Ocean Spray's Markham facility combines Key's proprietary state-of-the-art color cameras and laser technology on one powerful sorting platform. Color sorting maximizes the removal of defects while laser sorting maximizes the removal of foreign material. Combining laser sorting with color sorting achieves unmatched product quality and optimizes food safety.

"Ocean Spray uses state-of-the-art equipment to insure the highest product quality and product integrity. I know a lot of food and beverage companies talk about quality and integrity. But at Ocean Spray, it's much more than a message or a tag line. It's a way of life," commented Lowder.

Iso-Flo vibratory shakers form an integral part of the sanitary Ocean Spray processing line.
